AX88772A schematic
(12MHz/25MHz Crystals,
EEPROM,
RJ-45 Transformer,
USB Connector,
Power/Reset Circuit)

Note:

1. Please refer to AX88x72A USB-to-LAN Application Design Note for more AX88x72A PCB layout design notes.
2. Please contact ASIX Support (support@asix.com.tw) to get AX88x72A EEPROM User Guide for more details about AX88x72A EEPROM setting.
3. Please deliver us your AX88x72A schematic and your AX88x72A EEPROM data file for further review.

ASIX ELECTRONICS CORPORATION		
Title AX88772A Demo Board Reference Schematic		
Size B	Document Number Index	Rev 1.34
Date:	Monday, May 18, 2009	Sheet 1 of 3

Power and by-pass capacitors *Note2/*Note6/*Note8

Reset Circuit *Note11

12MHz +- 30ppm Crystal for USB interface *Note3

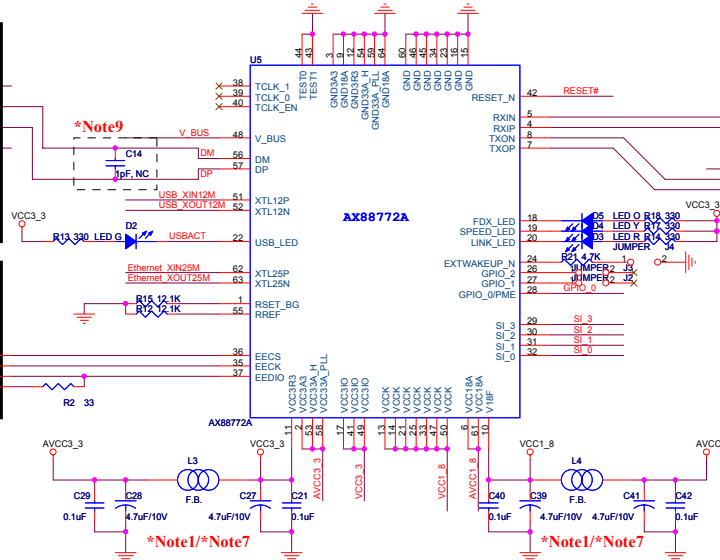

USB Connector

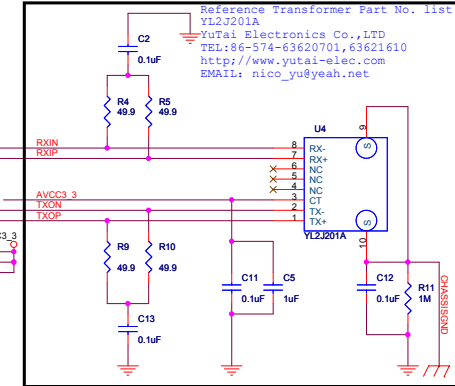

25MHz +- 30ppm Crystal for Ethernet interface *Note4

93C56 or 93C66 EEPROM *Note5

RJ-45 Connector + Transformer (Turns Ratio 1CT:1CT, with auto-MDIX)

Serial Interface *Note10

***Note1:**
AX88772A on-chip 3.3V to 1.8V regulator is a low dropout regulator (LDO), which requires some large external compensating capacitors on its input (pin #10) and output (pin #11) pins. The C21, C27, C39 and C40 capacitors are the compensating capacitors for the on-chip regulator.

***Note2:**
The L1, L2, C7, C8 and U8 should be as close as possible.

***Note3:**
The 1M feedback resistor is not necessary for 12MHz crystal circuit because it has been integrated into AX88772A. The reference 12MHz crystal is the NSK NXH-53 SMD 12MHz crystal with CL 16pF and ESR max. 90 Ohm.

***Note4:**
The 1M feedback resistor is necessary for 25MHz crystal circuit. The reference 25MHz crystal is the NSK NXH-53 SMD 25MHz crystal with CL 20pF and ESR max. 70 Ohm.

***Note5:**
The AX88772A supports 16-bit mode 93C56/93C66 EEPROM. The R22 resistor is not mounted on AX88772A demo board since the ATMEL AT93C66A EEPROM will set to 16-bit mode by default when the ORG pin is floating. Please select the 93C66 EEPROM if you need to implement the serial interface function on your AX88772A application.

***Note6:**
The 5V power signals between the USB VBUS and the regulator 5V input should be isolated with a Ferrite Bead (L1).

***Note7:**
The analog powers and digital powers should be isolated with a Ferrite Bead (L3, L4).

***Note8:**
All power pins should be implemented with a by-pass capacitor, and the by-pass capacitors should be as close as the power pins.

***Note9:**
The C14 cap between the DP and DM pins is optional for you to filter the common-mode noise and should be placed as close as pin #57 and #56 if necessary.

***Note10:**
Please refer to AX88x72A datasheet for the details of the serial interface function.

***Note11:**
The RC reset circuit is recommended for a better reset timing and the Reset IC circuit is optional.

Revision History

Revision	Date	Comment
V1.0	01/05/07	1.Initial Release.
V1.1	07/10/07	1.Rearrange the whole schematic for easy read.
		2.Remove R19, R20 4.7K resistors.
		3.Change C27 from 0.1uF to 4.7uF/10V.
V1.2	08/23/07	1.Connect R12 and R15 to GND.
		2.Connect U4, U6, C12, C15 and R11 to CHASSIS GND.
V1.30	10/24/2007	1. Re-arrange the whole schematic.
		2. Change the revision format to x.xx.
		3. Add some notes to indicate the important information of this schematic.
		4. Correct the Ethernet transformer circuit (U4).
V1.31	11/20/2007	1. Add a note message for the reset circuit.
V1.32	01/17/2008	1. Add R22 resistor in the 93C66 EEPROM circuit to pull high the ORG signal for 16-bit organization and add more information in Note 5.
V1.33	12/11/2008	1. Changed the C1 of RC reset circuit from 0.1uF to 0.47uF for a better reset timing.
		2. Modified some descriptions in Notell about the reset circuit. To keep the RESET_N pin floating should be OK for AX88772A, but we suggest to add a RC reset circuit for a better reset timing.
V1.34	05/18/2009	1. Add some important note messages in Page 1.
